

A 3D cutaway rendering of a composite flood control structure. The structure is shown in cross-section, revealing a blue interior channel, a brown middle layer, and a grey outer shell. The background shows a city skyline under a blue sky.

**Program for Replacing Earthen Levees
with
MegaMold®
Monolithic Composite Concrete & Steel Flood Control Structures**

Presented to

**State of Louisiana
Office of Coastal Protection and Restoration
Louisiana Applied Coastal and Engineering Sciences Division**

By
Frank K. Johnson, P.E. / Dr. Minhaj Kirmani, P.E.

MegaMold®

Levee Replacement Program

- Louisiana Coastal Master Plan Objectives
 - Reduce economic and community losses due to storm based flooding
 - Protect concentrated assets
 - Protect distributed assets
 - Protect strategic assets

- CPRA Plan
 - Seeking comprehensive solutions that achieve the **dual objectives of**
 - Coastal restoration
 - Hurricane protection

MegaMold®
Monolithic Cast-in-Place Concrete Flood Control Structure
Typical Construction Sequence

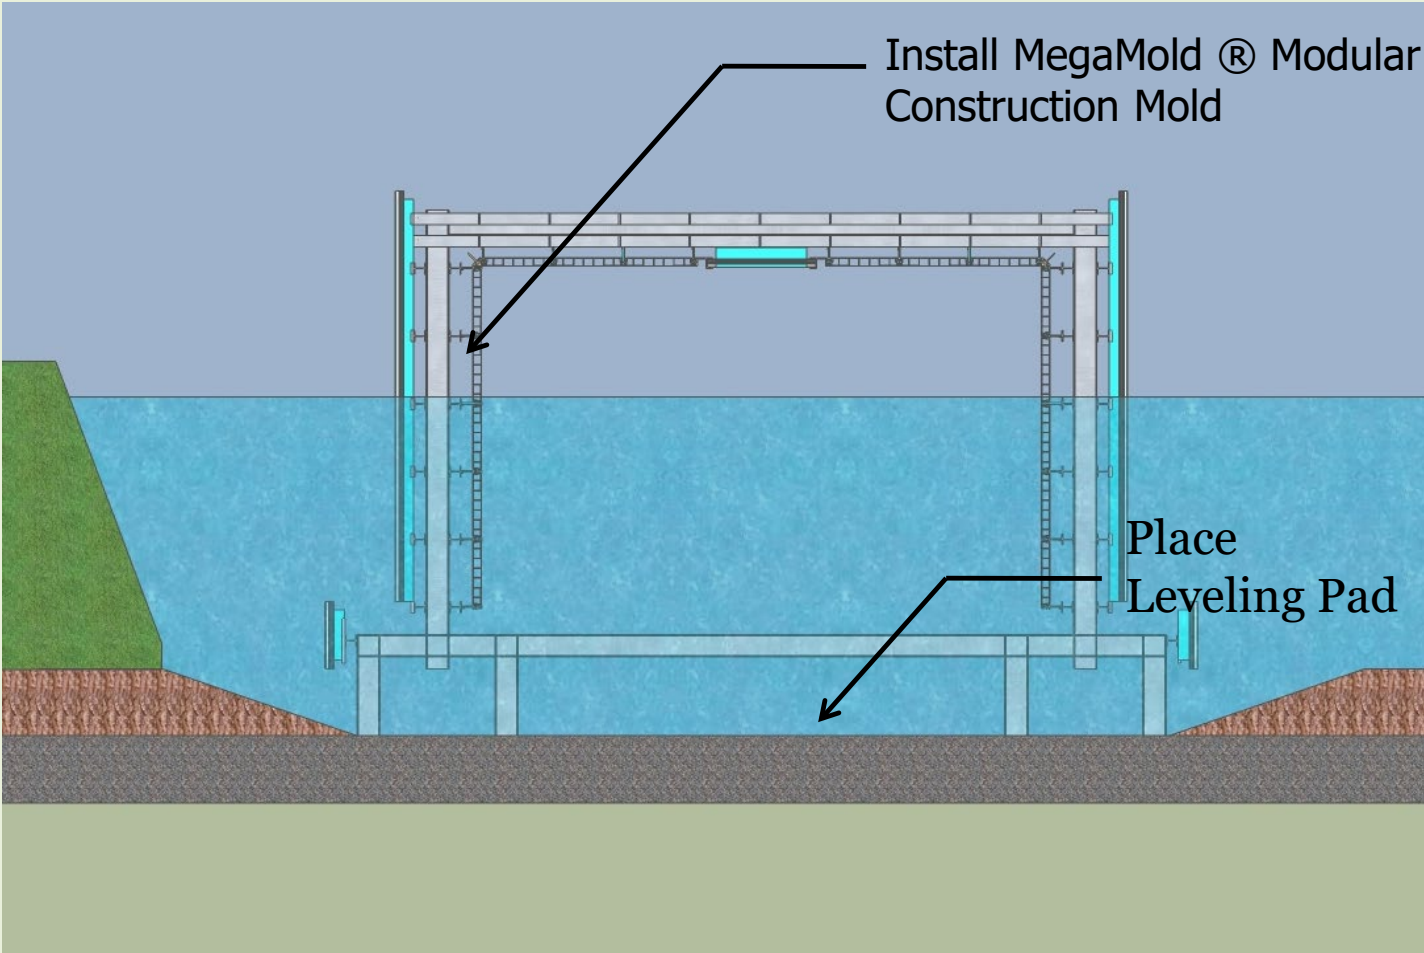

Existing Condition

MegaMold ® Monolithic Cast-in-Place Concrete Flood Control Structure Typical Construction Sequence

Dredging

MegaMold ® Monolithic Cast-in-Place Concrete Flood Control Structure Typical Construction Sequence

Module Installation

MegaMold ® Monolithic Cast-in-Place Concrete Flood Control Structure Typical Construction Sequence

Backfill Base Material

MegaMold ®

Monolithic Cast-in-Place Concrete Flood Control Structure

Typical Construction Sequence

Tremie Concrete Construction

MegaMold ® Monolithic Cast-in-Place Concrete Flood Control Structure Typical Construction Sequence

Continue Casting Concrete Walls

MegaMold ®

Monolithic Cast-in-Place Concrete Flood Control Structure

Typical Construction Sequence

Continue Casting Concrete Roof Slab

MegaMold ® Monolithic Cast-in-Place Concrete Flood Control Structure Typical Construction Sequence

Final Condition

MegaMold ®

Monolithic Cast-in-Place Concrete & Steel Composite Flood Control Structures

Combine the Advantages of Earthen Berms and T-Walls

- Monolithic concrete construction
- Lightweight
- Stable configuration
- Compatible with sheet pile cutoff

Additional Benefits

- Rapid construction
- Versatile configuration
- Construction in the wet
- Multi-functional

MegaMold ®
Monolithic Cast-in-Place Concrete & Steel Composite
Flood Control Structures

- Permanently eliminate the threat of catastrophic flooding from 500-year storms or greater;
- Are more durable and reliable than earth, sand and rock structures;
- Are not subject to overtopping, breaching or undermining;
- Are more economical to construct than repairing and upgrading existing earthen levees;
- Are custom-engineered to serve as all-weather roadways, protected utility corridors, and/or foundation structures for commercial and residential buildings.
- Are constructed quickly without stressing the environment or local community

The MegaMold® Solution

Prevent Catastrophic Flooding

**Contain Waters of Outfall Canal Between Two MegaMold®
Monolithic Concrete & Steel Flood Control Structures**
